

Cybervast B2B AI Lead Qualification & Follow-Up Workflow

System Design

1. System Architecture

2. Routing & Outputs

Recommended Category	Primary Action	System Output
HOT	Prioritize for sales attention	Lead record in Google Sheets + internal Slack notification + confirmation/follow-up communication
WARM	Route for follow-up	Lead record in Google Sheets + internal Slack notification + appropriate follow-up communication
COLD	Keep available for nurturing	Lead record retained in Google Sheets; no Slack alert required

Cybervast B2B AI Lead Qualification & Follow-Up Workflow

Process Flow

Step	Stage	What Happens
1	Prospect submits B2B enquiry	Tally captures the information provided by the prospect.
2	Enquiry enters the workflow	n8n receives the submission and prepares the lead information for processing.
3	Lead record is created	The enquiry information is stored in Google Sheets for tracking and review.
4	AI assesses the lead	Groq analyzes the enquiry, recommends HOT, WARM, or COLD, and provides supporting reasoning.
5	Lead is routed	n8n directs the enquiry to the appropriate branch based on the recommended category.
6	Internal action is triggered	HOT and WARM leads are surfaced in Slack for sales attention or follow-up. COLD leads remain available for nurturing.
7	Prospect communication is sent	The workflow sends the appropriate email communication while keeping important business decisions under human control.
8	Human review continues	The business team reviews the recommendation and decides the final sales action.

Human Oversight

The AI classification is a recommendation. Final qualification, sales decisions, and important follow-up actions remain under human control.

Monitoring

Error Monitoring	Detects workflow failures and sends alerts when an execution encounters an error.
Daily Health Check	Provides routine visibility into the availability of important workflow components.
