

VELA - AI Customer Support & Shopping Assistant

System Design

1. System Architecture

2. Response Routing

Route	When It Is Used	System Action
ANSWER	The request can be handled using approved VELA knowledge and available context.	Relevant knowledge is retrieved and the customer receives a grounded response through Telegram.
HANDOVER	The request requires live information, seller confirmation, approval, or a business decision.	The request is recorded for follow-up and the seller receives a structured handover notification.

3. Knowledge Grounding

Component	Purpose
VELA Knowledge Base	Stores approved VELA-specific information used for product, sizing, materials, gemstones, ordering, delivery, returns, care, and policy questions.
Customer Records	Provides available customer information when it is required for the interaction.
Conversational Context	Maintains relevant context across the conversation so the assistant can respond consistently.

VELA - AI Customer Support & Shopping Assistant

Process Flow

Step	Stage	What Happens
1	Customer sends a message	The customer interacts with VELA through Telegram.
2	Message enters the workflow	n8n receives the request and prepares it for processing.
3	Intent and information need are identified	The system determines what the customer is asking and what information is required.
4	Relevant knowledge is retrieved	For VELA-specific questions, relevant approved information is retrieved from the Supabase knowledge base.
5	Context is combined	Retrieved knowledge is combined with relevant conversational context and available customer information.
6	AI prepares the response	OpenRouter generates a response grounded in the available information.
7	Request follows ANSWER or HANDOVER	Routine requests are answered; requests requiring live information, approval, or seller action are handed over.
8	Seller is notified when required	Handover information is recorded and a structured notification is sent to the seller.
9	Monitoring supports reliability	Error alerts and daily health checks provide visibility into workflow and service availability.

Human Oversight

VELA handles routine support using approved information. Requests involving live business information, approvals, exceptions, refunds, exchanges, discounts, custom orders, or other seller decisions are routed for human attention.

Monitoring

Error Monitoring	Detects workflow failures and sends alerts when an execution encounters an error.
Daily Health Check	Checks important components supporting VELA, including the main workflow, knowledge base, customer records, handover records, and AI service connectivity.
